

# Arkæologi i naturfags- undervisningen

## Abstract

### Archaeology in science teaching

*In the project Archaeology and Natural Science: science teaching and cultural history, the Museum of Copenhagen explores the potential of working with archaeology as the basis for science teaching in elementary school. In the project, the museum collaborates with teachers and students to develop new methods in science teaching to strengthen the students' science skills and their general and democratic formation by involving them in professional archaeological and scientific work in the Archaeological Workshop at the museum. The students work hands-on with the authentic archaeological material and use scientific archaeological methods alongside the professional museum staff.*
